

In-Chair Imaging and Transport

Stretcher-Chairs provide concierge service to your patients from the moment they arrive. A radiolucent back allows the patient to get imaged without transferring to another piece of equipment. Procedures, both easy and complex, can be performed in the chair, in any position. The patient is easily transported from one department to another, safely and comfortably.

Models can be customized to meet specific needs and requirements.

MRI Safe Stretchers & Wheelchairs

Constructed of non-magnetic materials, these wheelchairs are ideal for transport into the suite. The Gendron MRI Transport Wheelchair and stretcher models 4650 and 4850 are blue to help staff immediately identify MRI safe wheelchair equipment. The chair features swing away footrests as well as removable full length armrests for comfort and convenience. Ideal for transferring patients from one department to another.

Theranostics Chairs

The Elevate ZG Exam Lift and the Durable Power (the same chair without the lift) create a comfortable place for patients and a safe environment for nurses who can't spend the day bending over them. Both chairs allowing patients to dial in comfort while they wait for any injections that enhance imaging to travel throughout the body or any other diagnostic or therapeutic procedure they are undergoing.
